# Empowering Security with Facial Recognition

- **More Verification Options** - Handheld facial verification provides security and safety professionals another option for employee identification.

- **Greater Verification Convenience** - Quickly verify workers and visitors when credentials are lost, forgotten, or difficult to access under workwear.

- **Multi-Factor Authentication** - Perform biometric verification and multi-factor authentication with existing credentials for high security areas.

- **Accelerated Emergency Mustering** - Quickly scan groups of faces at assembly areas all at once and account them as safely evacuated.

- **Works with Existing ID Images** - User ID photos already enrolled in the access control system is all that is needed to start using facial recognition.

How It Works

XPressEntry is a handheld access control and emergency mustering solution which integrates with 30+ access control systems. Embedded facial recognition software on XPressEntry handheld badge and biometric readers pulls existing enrolled employee photos (256x256 pixels minimum resolution required) in the access control database, creates facial recognition templates, and locally stores them in XPressEntry. When security and safety professionals perform facial recognition verification, the rear 13.0 mega pixel camera on the XPID200 series readers is activated, captures any face images in view, and quickly verifies these against the facial template information on record.
